Join us for this webinar to hear Imprivata experts discuss the value of a digital identity framework and identity and access management (IAM) as a foundation for a comprehensive IT security strategy.

With the right digital identity framework organisations can protect themselves with a unified platform for critical solution areas including:

- Secure access to shared clinical devices like mobile phones/tablets
- Re-authentication and witnessing workflows in clinical applications
- AI for patient privacy and drug diversion
- Privileged access management
- Identity governance for fast provisioning and user lifecycle management
